

# Systematic Training Programme and Certification for Healthcare and IT Practitioners

## eHealth Training for eHealth Executives

Pascal Tse  
Chief Information Technology Officer  
St. Teresa's Hospital  
[pascaltse@sth.org.hk](mailto:pascaltse@sth.org.hk)  
28th April 2011

2

## Agenda

- Clinical Decision Support Systems
  - Current Healthcare Process
  - Pain Points
  - Types of CDSS
  - CDSS Selection Criteria
- Organization and Management of Healthcare Services
  - How to equip the taskforce
    - Health Informatics Professionals
    - IT Project Management
    - Change Management
- Expectations Managed
  - Incidents of patient confidentiality breach
  - Risks Analysis
  - Policy, Procedures and Means to protect patient data

Systematic Training Programme and Certification for  
Healthcare and IT Practitioners

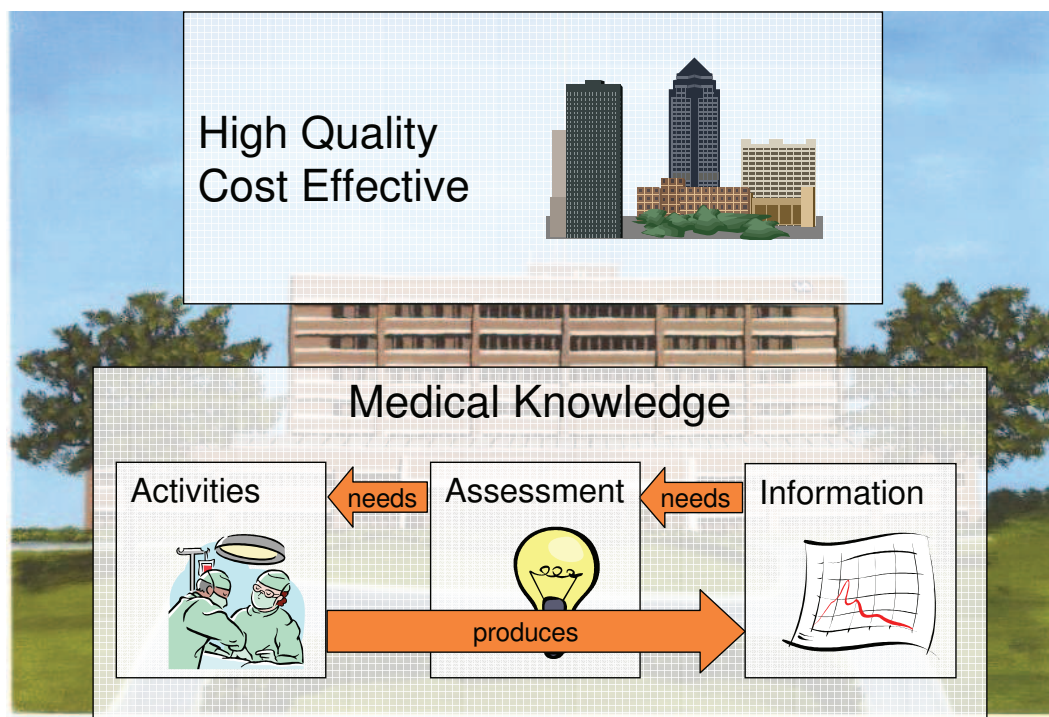

# Clinical Decision Support Systems

## Current Healthcare Process

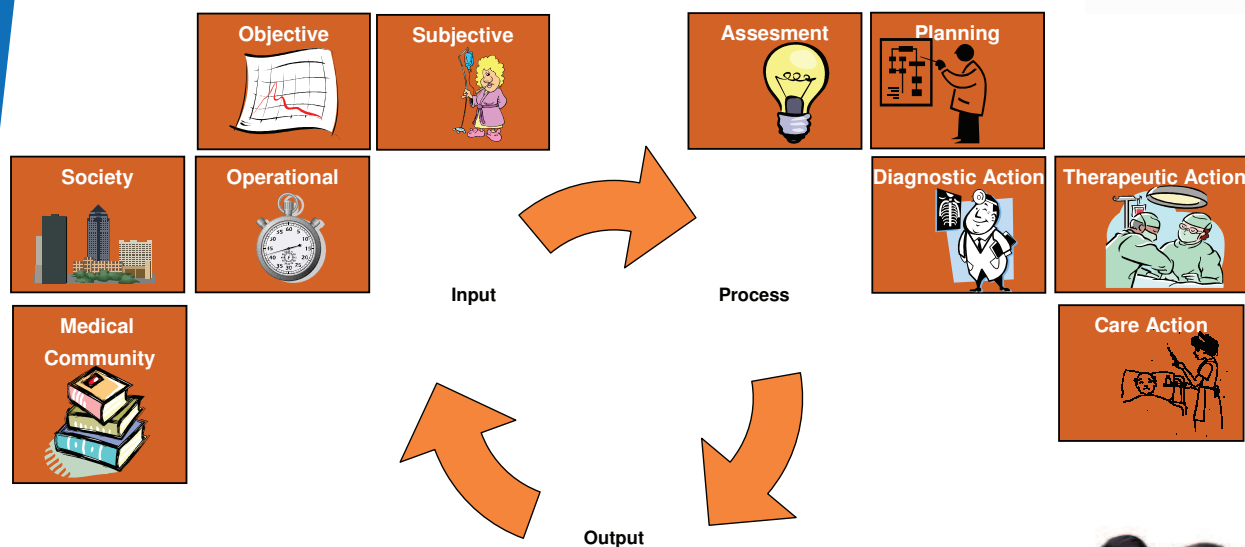

## The Hospital

Source: Dr. Dirk Colaert MD, "The Pain Points in Health Care and the Semantic Web", Advanced Clinical Application Research Group, Agfa HealthCare.

# Healthcare as a Process

Source: Dr. Dirk Colaert MD, "The Pain Points in Health Care and the Semantic Web", Advanced Clinical Application Research Group, Agfa HealthCare.

## Clinical Decision Support Systems

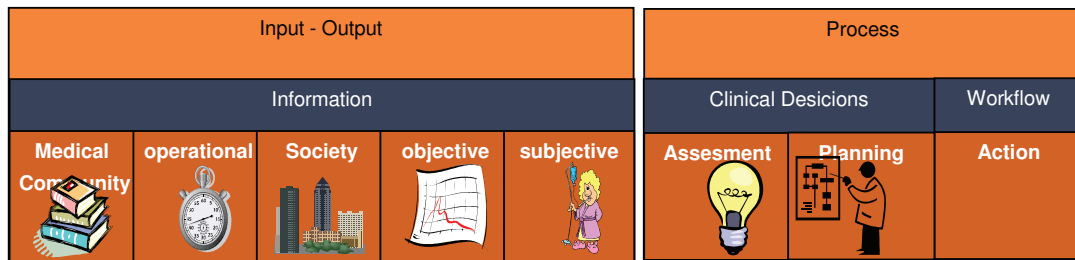

### Pain Points

# Healthcare as a Process: Pain Points

- Isolated information
- Fragmented information
- Not accessible information
- Too much information
- Bad information presentation
- Only clinical data is kept (no knowledge)
- Some information is not computer usable (free text, image features, (genome in the future))
- No feed back to medical community and society
- Complex decisions
- Lack of training
- Changing knowledge
- Medical errors
- Inefficient workflow
- Understaffing
- No operational information
- No infrastructure information
- No common language

Source: Dr. Dirk Colaert MD, "The Pain Points in Health Care and the Semantic Web", Advanced Clinical Application Research Group, Agfa HealthCare.

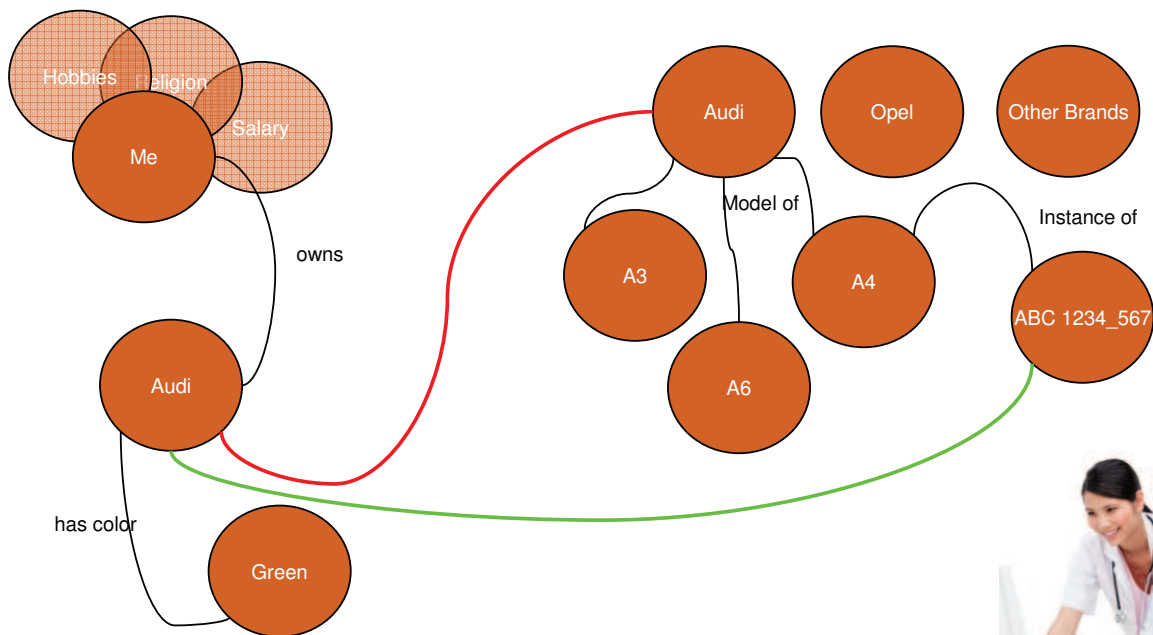

## Connected Knowledge

- Data -> Information -> Knowledge
- Knowledge = Collect facts (Data) + Organise data (Information) + Associate meaning (Understanding)
- Intelligence: Latin 'Intellectus' comes from Intelligere meaning connect between
- A formal description of a domain, using connected facts and concepts is called 'an ontology'
- By linking ontologies they are merged to "connected knowledge": very powerful yet dangerous!

## Simple ontology

Source: Dr. Dirk Colaert MD, "The Pain Points in Health Care and the Semantic Web", Advanced Clinical Application Research Group, Agfa HealthCare.

## Knowledge: Traditionally 'assumed'

- Complaint: Dyspepsia
- Doctor would prescribe some antacids (e.g. Mylanta) or H2 blocker (e.g. Pepcidine)
- To ease Dyspepsia (epigastric discomfort) empirically

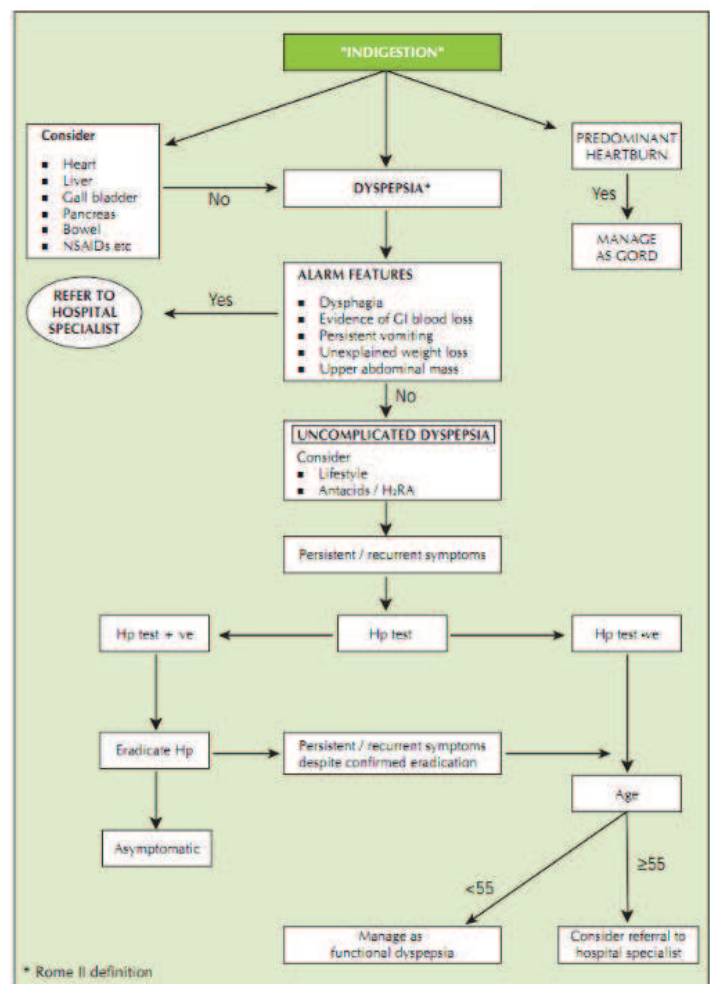

# Knowledge: Traditionally 'assumed'

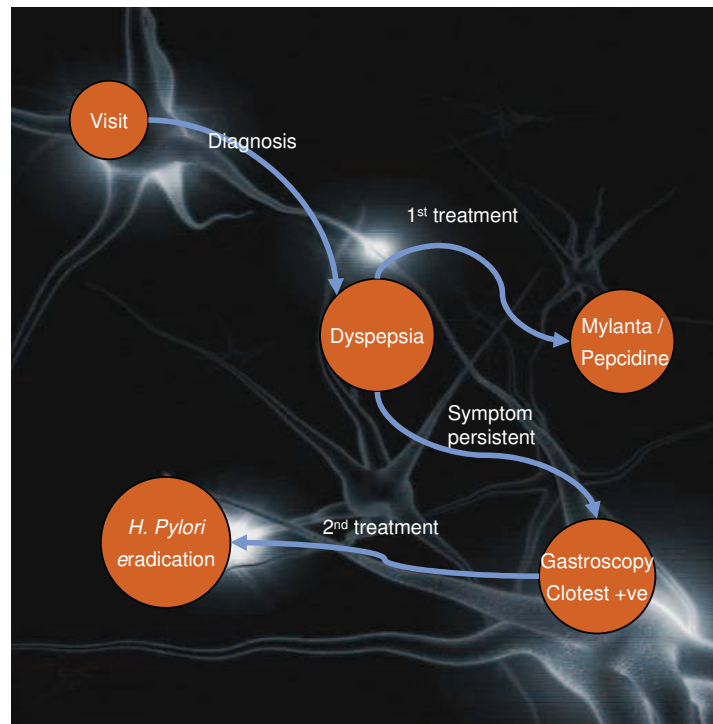

## Connected Knowledge: explicit

- Now with the help of clinical decision support system, doctors may make their diagnosis and give treatment more adherence to Evidence based medicine (/ guidelines)
- For example, the doctors are guided to assess the patients (such as considering the risk factors, perform appropriate tests) and make appropriate decision.

## Connected Knowledge: explicit

## Connected Knowledge

- Examples of ontologies and rules: medical vocabulary, patient clinical data, infrastructural data
- Because ontologies are formally described, computers can use them, take rules and reason about the concepts.
- Technologies, able to connect facts into ontologies, connect ontologies to each other and reason about it with rules gives us the means to improve vastly the current painful processes in healthcare.
- Examples:
  - Use of a Terminology Server for Controlled Medical Vocabulary
  - Decision support and clinical pathways

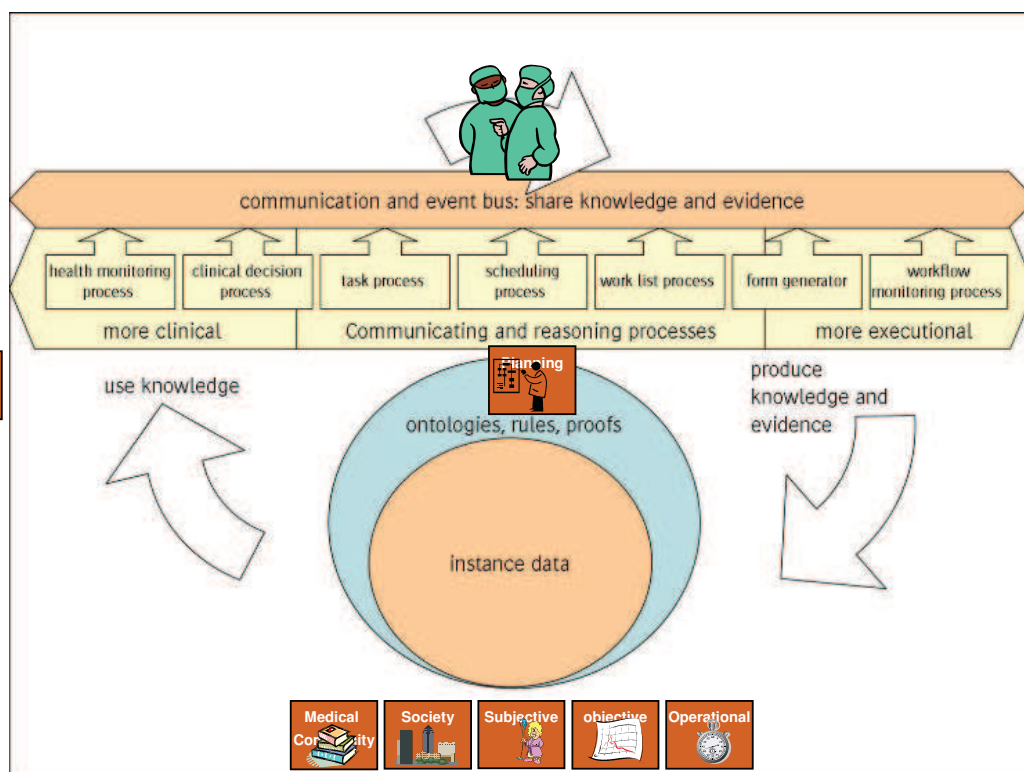

# Decision Support and Clinical Pathways

- Clinical Pathway: a way of treating a patient with a standardized procedure in order to enhance the efficiency, increase the quality and lower the costs.
- Usually represented in a script book and/or flow chart diagram
- Issues with conventional Clinical Pathways:
  - Not very dynamic: “one size fits all”
    - Not adapted 100% to the individual patient
  - Not mergeable
    - How can you enroll a patient into 2 pathways?
  - Difficult to maintain: mix of procedural and declarative knowledge

Source: Dr. Dirk Colaert MD, “The Pain Points in Health Care and the Semantic Web”, Advanced Clinical Application Research Group, Agfa HealthCare.

# Adaptable Clinical Workflow Framework

Source: Dr. Dirk Colaert MD, “The Pain Points in Health Care and the Semantic Web”, Advanced Clinical Application Research Group, Agfa HealthCare.

## Organisation and Management of Healthcare Providers

## What is eHealth Systems?

- Healthcare practice supported by electronic processes and communication
- Interchangeable with health informatics with a broad definition covering electronic/digital processes in health

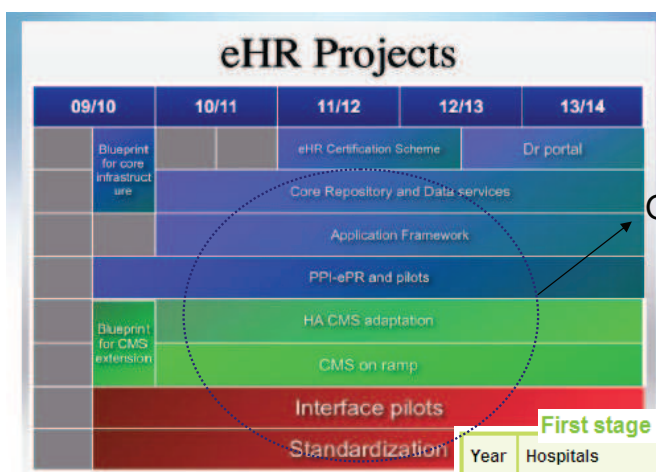

## What is eHR?

- A record in electronic format containing health-related data of an individual
- Stored and retrieved by different healthcare providers including doctors and other healthcare professionals for healthcare-related purposes

## eHR Projects Timeframe

First stage of Development Programme (2009/10 to 2013/14)

Year	Hospitals	Clinics	Ancillaries
2009	Radiological image sharing with private hospitals; Integration of Healthcare Voucher scheme with eHR		
2010	Pilot use of SmartID for patient authentication		Laboratory sharing
2011	Clinical Management System (CMS) adaptation basic modules	Community Person Master Index (PMI)	
2012	Begin patient enrolment	Clinical Management System (CMS) on ramp	Hong Kong Drug table
2013	Shared records in Doctor Portal		

## Phase 1 Roadmap

- By 2014
  - eHR Sharing Infrastructure Core Component
    - To Design & Build core eHR sharing infrastructure between eMR/ePR systems by individual health care providers
  - HA CMS Adaption and Extension Component
    - To facilitate the adoption and deployment of Hospital
  - Standardization and Interfacing Component
    - To develop technical standards for different IT systems to interoperate and interconnect through the eHR sharing infrastructure.

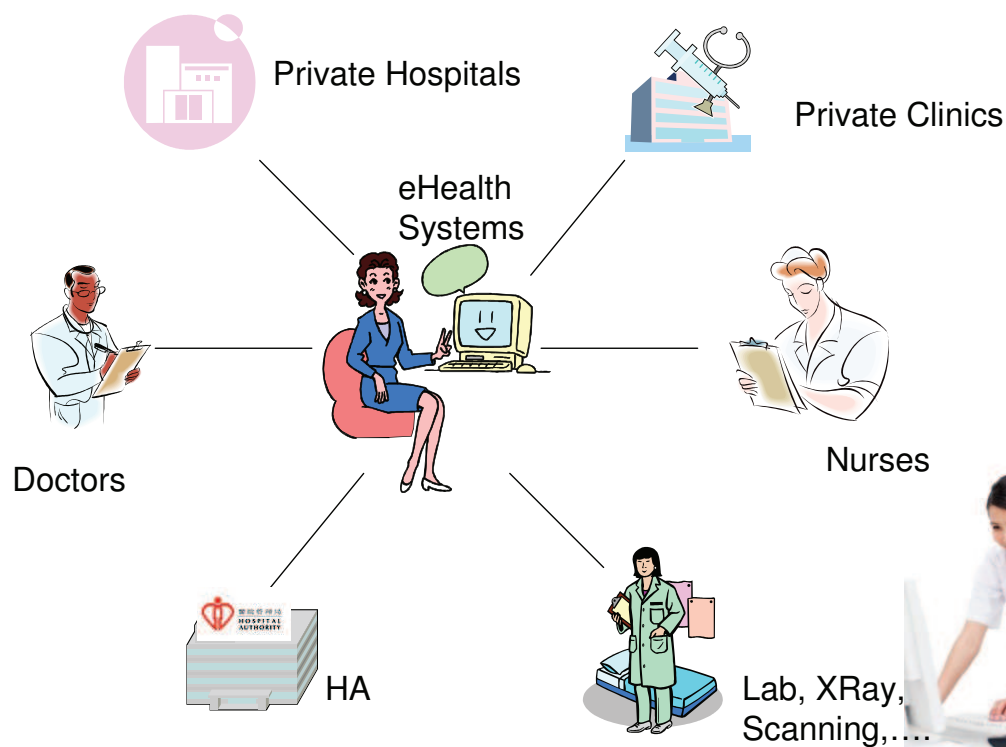

## How to equip the Task Force?

- Health Informatics Professionals
- IT Project Management
- Change Management

# Health Informatics Professionals

## Existing eHealth Systems

- Different systems in different healthcare service providers
- Different standard among different healthcare service providers. For example
  - Person Identity: HKID No, Surname, Given name, Chinese Name, Other Name
  - Date of Birth: dd/mm/yyyy or mm/dd/yyyy or dd-mon-yyyy or ddmmyyyy
  - Marital Status: Single/Married/Divorced,.. or S/M/D
  - Sex: Male/Female/Undefined or M/F/U
  - Type of Document: HKID, Passport,...
  - Address
  - Phone Number: With/Without area code
  - Different data type and data length
  - ....

# What IT can do for “existing eHealth Systems”?

## eHR Standard Interface and format

### Private Hospital

Sex: Female/Male  
DOB: dd-mm-yyyy  
Marital Status:  
Single/Married/Divorced  
Type of Document:  
HKID/ENP/DI,...

Field	Value
Gender	Female
DOB	1980-01-01
Marital Status	Single
Document Type	HKID

### Private Clinic

Sex: F/M  
DOB: dd/mm/yyyy  
Marital Status: 1,2,3  
Type of Document: HKID,  
Entry Permit,  
Document of Identity,...

### Transformation Process

Sex: F/M  
DOB: EDMY  
Marital Status: S/M/D  
Type of Document: ID/EN/DI

HA

## NO eHealth Systems

### Disadvantage

- Difficult to obtain patient information
- Paper Loss
- Storage
- Security
- Not systematic to keep track of

- Medical History
- Treatment Details
- Prescription Details,....

"You've gotta help me! I can't read my own writing!"

- Handwriting
  - Cannot read
  - Misunderstand

This is a super C  
my name.

## Benefits of eHR sharing system

### ○ Patients Benefits

- Comprehensive online record for healthcare providers
- Timely and accurate information
- Reduce duplication of tests and treatment

### ○ Clinicians Benefits

- Efficient and quality assured clinical practice
- Reduce error associated with paper records

### ○ Social Benefits

- Improve disease surveillance and monitoring of public health
- Help gather more comprehensive statistics of formulating public health policy
- Bring efficiency gain in total health expenditure

## IT Project Management

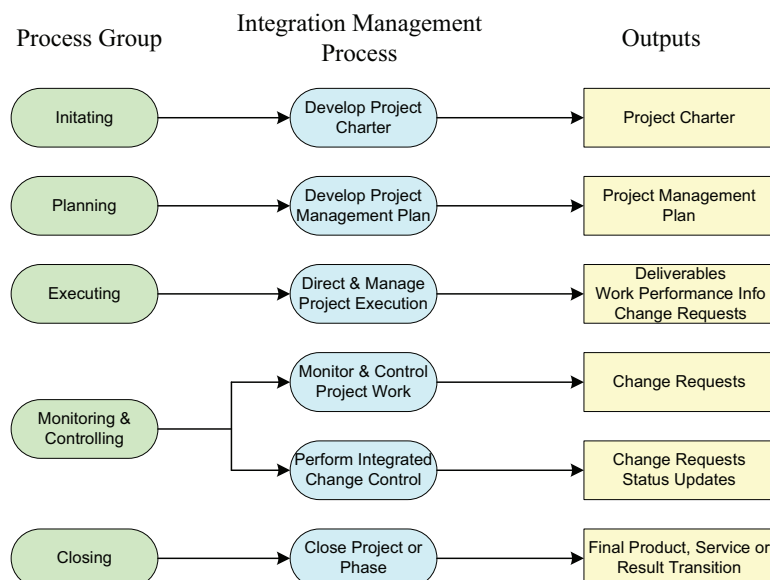

# IT Project Management

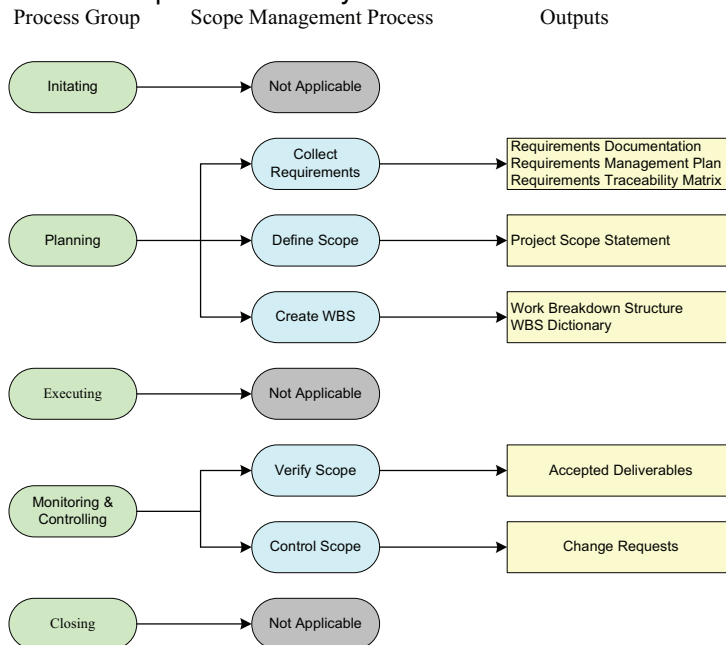

## Integration Management Process

- Integration management is the practice of making certain that every part of the project is coordinated

# Scope Management

- Scope management is a presentation of logical processes to understand requirements, define, break down, and control the scope of the project, and verify that project was completed correctly.

## Scope Management Cont'd

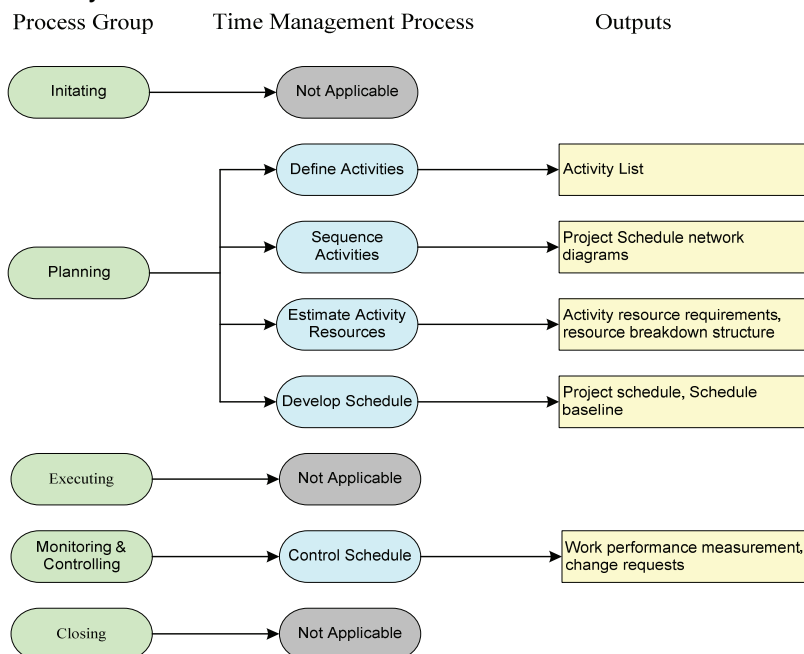

*A clear project title means one target, one arrow.*

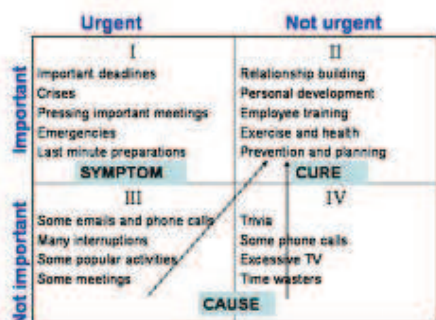

# Time Management

- Time management is the act or process of exercising conscious control over the amount of time spent on specific activities, especially to increase efficiency or productivity.

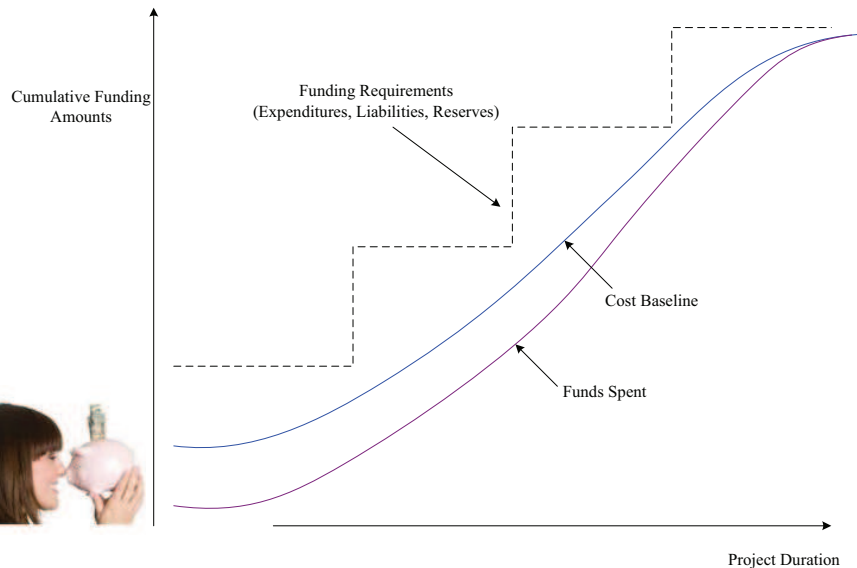

# Time Management Cont'd

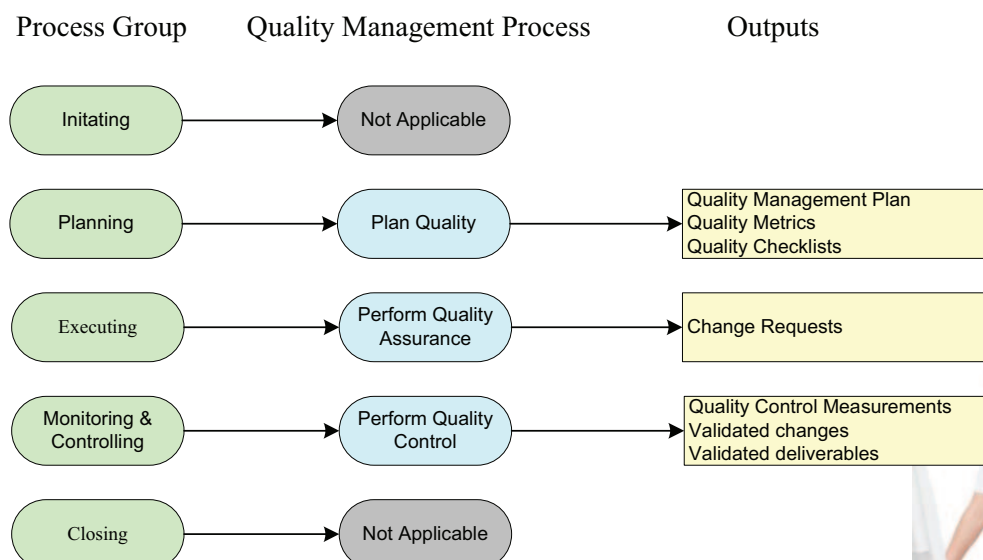

# Cost Management

- Cost management is the process by which companies control and plan the costs of doing business. Individual projects should have customized cost management plans, and companies as a whole also integrate cost management into their overall business model. There is no single accepted definition for this term, because it has such broad applications and possible strategies.

# Quality Management

- Quality management can be considered to have three main components: quality planning, quality control, quality assurance. Quality management is focused not only on product/service quality, but also the means to achieve it.

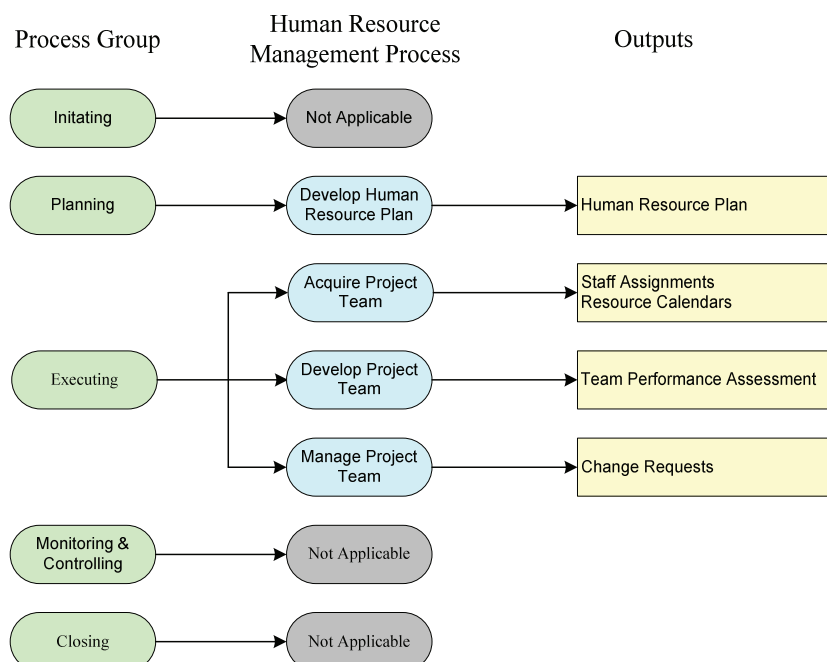

## Quality Management Cont'd

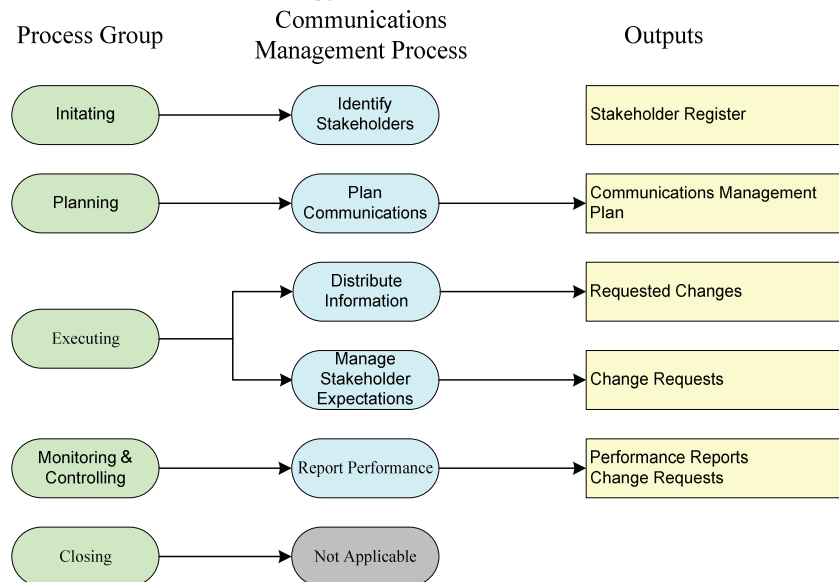

## Human Resource Management

- Human Resource management is to define a role for everyone on the project and to define the responsibilities for each of these roles.

# Communications Management

- Communications management is the systematic planning, implementing, monitoring, and revision of all the channels of communication within an organization, and between organizations; it also includes the organization and dissemination of new communication directives connected with an organization, network, or communications technology.

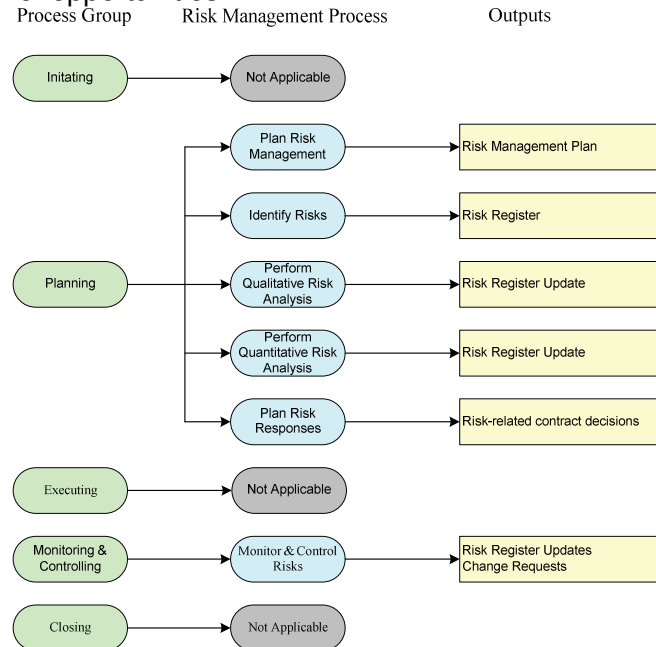

## Communications Management Cont'd

# Risk Management

- Risk management is the identification, assessment, and prioritization of risks as the effect of uncertainty on objectives, whether positive or negative) followed by coordinated and economical application of resources to minimize, monitor, and control the probability and/or impact of unfortunate events or to maximize the realization of opportunities.

## Risk Management Cont'd

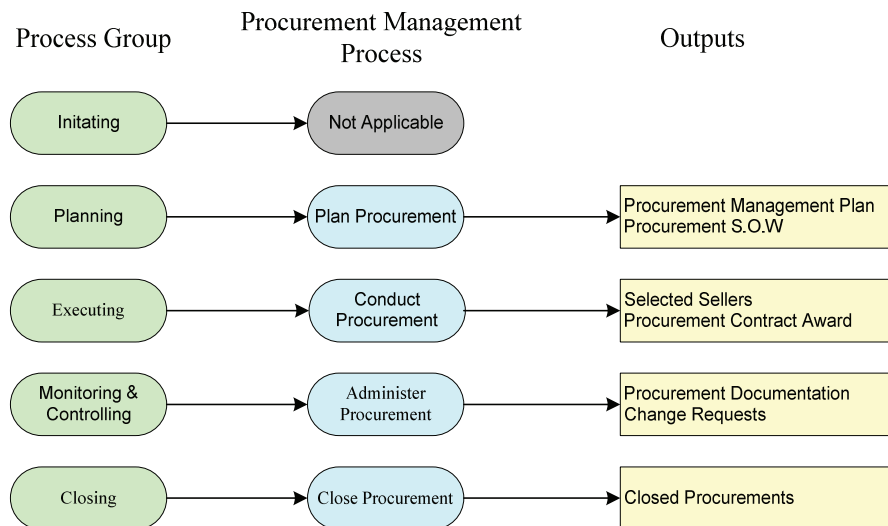

○

# Procurement Management

- Procurement management is the process companies use to purchase economic resources and business input from **suppliers** or vendors. This process helps companies negotiate prices and get the best quality resources for production processes.

# Change Management

# What is Change Management?

- **Change management** is a structured approach to shifting/transitioning individuals, teams, and organizations from a current state to a desired future state.
- It is an organizational process aimed at empowering employees to accept and embrace changes in their current business environment

## Change Management

### ○ 5 Common Observations

- Different people react differently to change
- Everyone has fundamental needs that have to be met
- Change often involves a loss, and people go through loss
- Expectations need to be managed realistically
- Fears have to be dealt with

## Different People react differently to Change

- The following diagram represents a spectrum of change

Stability ----- Change

- Some people like to be at the STABILITY end of the spectrum, but some like to be at the CHANGE end
- Problem arises
  - Strong dissatisfaction
  - Stress
  - Negative attitudes
  - Resistance to change
  - Loss of rational judgment

## Everyone has Fundamental needs

- 3 basic needs of fundamental importance in people's reaction to change
  - The need for control
  - The need for inclusion
  - The need for openness
- Vary between people in any change process, there is always
  - some degree of need
    - for control over environment/destiny
    - to be included in the process of forming the change that is taking place
    - For managers/leaders to be open with information

## Change Often Involves A Loss

- The relevance of the “Loss Curve” to a change management programme depends on the nature and the extent of the loss.

## Change Often Involves A Loss Cont'd

### ○ Loss Curve – “Sarah”

- S-hock
- A-nger
- R-ejection
- A-cceptance
- H-ealing

## Managed Expectations

- Expectations have to be set at a realistic level

## Fears have to be dealt with

- Fears need to be addressed
- Help people to recognize how eHealth/eHR can benefit the patient/Clinician/society

## Tips to apply change management

- Give people information (don't give overoptimistic speculation)
- For large groups, produce a communication strategy that ensures the information flows efficiently and comprehensively
- Give people choices to make
- Give individual opportunity to express their concerns and provide reassurances
- Give people time
  - Support their decision making
  - Provide coaching
  - Counselling as appropriate

## Conclusions

- Health Informatics Professionals
  - Build eHealth & eHR with standardized and interfacing format
- IT Project Management
  - Scope
  - Time
  - Quality
  - Risk
- Change Management
  - Align expectations
  - Information flow efficiently and comprehensively
  - Coaching & Counseling

The End
